

HIV/AIDS Monitoring Report

Department of Health and Human Services
Data through June 30, 2001

The mission of the City of Long Beach Department of Health and Human Services is to improve the quality of life of the residents of Long Beach by addressing the public health and human service needs ensuring that the conditions affecting the public's health afford a healthy environment in

Department Management Team

which to live, work and play.

Confidentiality Practices in the Handling of HIV/AIDS Surveillance Information

The HIV/AIDS Surveillance Program (HASP) studies the distribution and determinates of the HIV/AIDS epidemic in the population of Long The program collects Beach. information on incident cases of AIDS and characterizes them by gender, race/ethnicity, age, geographical distribution and transmission mode. All surveillance data containing identifying information are considered highly confidential and HASP adheres to strict guidelines for handling this information. This includes HIV/AIDS surveillance data that are collected under the authorization of California Administrative Code, Title 17, Section 2500 (a) (d), such as patient name, social security number, address, telephone number, or any other locating or personal identifying information. All information collected under this law is considered confidential and must be treated in a manner that is consistent with the level of security required.

In order to comply with these laws and ensure patient confidentiality, HASP has established

comprehensive procedures to protect confidentiality and ensure data integrity. These procedures have four objectives:

- To protect patient confidentiality by preventing unauthorized disclosure of information;
- To ensure the integrity of data by preventing unauthorized alteration;
- To prevent the loss of data through accidental or malicious acts, or equipment failures; and
- To prevent harm to HASP functions or image through unauthorized disclosures.

HASP procedures toward fulfilling these objectives include the following, for example:

- All HASP employees receive training in confidentiality and security issues on an ongoing basis. They are required to read, retain, and sign a copy of the HASP confidentiality agreement.
- Employee access to confidential

HIV Antibody Testing Program Data	8
Technical Notes	9
Health Care Providers Reporting Responsibilities	11

records which contain patient-specific identifiers is granted only to those employees who must have access to perform their assigned duties.

- All materials containing patient identifying information is maintained in restricted access areas.
- All records containing patient identifiers are kept in bar-locked files at all times, unless they are in direct possession of an authorized employee during office hours or during necessary field work.
- A numeric key-pad lock is used outside of the HASP office and each authorized employee has a unique security code to enter the office. The keypad lock has the ability to record who enters the office and when.
- Confidential information is never transmitted via facsimile.
- For statewide aggregate data analyses, information on AIDS cases is transmitted to the State Office of AIDS - AIDS Case Registry via diskette through encrypted software which removes all personal identifiers.

These are only some of the measures HASP has implemented to ensure the confidentiality of the affected population. Failure to comply with this policy may result in disciplinary action and/or subject an employee to civil and/or criminal prosecution. The City of Long Beach as well as the State of California has not had a breach of confidentiality in their HIV/ AIDS case reporting history and our goal is to maintain this level of integrity.

AIDS SURVEILLANCE PROGRAM

Introduction

Comprising nearly 50 square miles at the southernmost end of Los Angeles County, Long Beach has approximately a half-million residents, making it the fifth largest city in California and the 32nd largest in the United States (based on 2000 LACo. Urban Research Unit). One of 61 health jurisdictions in California, the City of Long Beach has maintained the Health Department for more than 90 years.

Its size, diversity and geographic location in a major population center have made Long Beach particularly vulnerable to HIV and AIDS. With a cumulative incidence rate of 876.38 AIDS cases per 100,000 residents (1981 through June 30, 2001), Long Beach's AIDS incidence rate per capita is over 80 percent higher than the incidence rate for all of Los Angeles County (433.27 cases per 100,000) and more than double the rate for the State of California overall (354.82 cases per 100,000), indicating that AIDS continues to be a significant public health issue in the City of Long Beach (Table 1).

TABLE 1
COMPARISON OF CITY OF LONG BEACH, LOS ANGELES COUNTY AND CALIFORNIA CUMULATIVE AIDS INCIDENCE RATE PER 100,000 POPULATION, 1981 THROUGH JUNE 30, 2001.

	2000 Population	Number of AIDS Cases	Cumulative AIDS Incidence Rate
City of Long Beach	450,603	3,949	876.38
Los Angeles County	9,884,300	42,826	433.27
California	34,336,000	121,831	354.82

Sources: California HIV/AIDS Reporting System, June 30, 2001 Long Beach HIV/AIDS Reporting System, June 30, 2001

The California Code of Regulations, Title 17, Section 2500, requires that all diagnosed or suspected cases of AIDS as defined by the Centers for Disease Control and Prevention (CDC) be reported within seven days to the local Health Officer. To facilitate reporting, the City of Long Beach Department of Health and Human Services maintains an AIDS Surveillance Program (funded by the State of California Department of Health Services Office of AIDS) which is responsible for collecting, analyzing and disseminating AIDS data.

Cumulative Cases

Since its first AIDS case report in February 1983, a cumulative total of 3,949 AIDS cases has been reported in Long Beach through June 30, 2001. The cumulative case fatality rate of 60 percent is similar to California (61%) and Los Angeles County (63%). Of the 3,949 reported AIDS cases, 1,592 people are currently living.

Race/Ethnicity

Of the 3,949 cumulative AIDS cases, approximately two-thirds (63.0%) are White (Table 2). While Whites still comprise the majority of the reported cases, the number of HIV infections may be decreasing in this

group. From July 2000 through June 2001, the percentage of AIDS cases reported in Whites was 50.0 percent. AIDS cases in Blacks, while contributing 17.0 percent to the cumulative cases, comprised 23.0 percent of the cases reported in the past year. Hispanic AIDS cases comprised about one-fifth (24.4%) of the cases reported in the last year, yet they make up 18.0 percent of the cumulative cases. The percentage of cases among Asian/Pacific Islanders during the past year (3.0%) is higher than the 1.7 percent reported cumulatively (Table 2).

TABLE 2
CUMULATIVE AIDS CASES BY RACE/ETHNICITY AND PERCENT OF POPULATION REPORTED 1981 THROUGH JUNE 30, 2001, CITY OF LONG BEACH

	2000 Population	Percent of Population	Number of AIDS Cases	Percent of AIDS Cases
White, Not Hispanic	160,452	35.6%	2,486	63.0%
Black, No Hispanic	68,443	15.2%	673	17.0%
Hispanic	142,049	31.5%	710	18.0%
Asian/PI	77,227	17.1%	68	1.7%
Amer.Ind./Alaska Nat.	2,432	0.5%	10	0.3%
Not Specified*			2	0.1%
TOTAL	450,603	100%	3,949	100%

^{*} These cases are pending investigation. Upon identification of race/ethnicity, cases will be reclassified into appropriate category.

Gender

The vast majority of AIDS cases in Long Beach are male (94.0 percent). However, the increasing percentage of female AIDS cases being reported each year suggests that more women may be becoming infected. During July 1, 2000 - June 30, 2001, 11.0 percent of the cases reported were in females, compared with a cumulative percentage of 6.0 for cases reported as of June 30, 2001 (Table 3).

TABLE 3AIDS CASES BY REPORT DATE AND GENDER, REPORTED JULY 1, 2000 THROUGH JUNE 30, 2001, AND CUMULATIVE TOTALS THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

	July 2000 – June 2001	1981 – June 2001
Male	186 (89.0%)	3,713 (94.0%)
Female	23 (11.0%)	236 (6.0%)
TOTAL	209 (100%)	3,949 (100%)

Age

Through June 30, 2001, almost half (48.4%) of the cumulative AIDS cases in Long Beach were diagnosed among people between the ages of 30 and 39. More than one-quarter of all cases were diagnosed among people between the ages of 40 and 49. This indicates that the majority of people with AIDS in Long Beach were infected in young adulthood. Almost sixteen percent of AIDS cases were diagnosed in people in their twenties, suggesting that a significant number of people with AIDS became infected during adolescence (Table 4).

TABLE 4
CUMULATIVE AIDS CASES BY AGE GROUP AND GENDER, REPORTED 1981
THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

	No. of Male Cases	No. of Female Cases	TOTAL
Under 13	5 (0.1%)	4 (2.0%)	9 (0.2%)
13-19	6 (0.2%)	5 (2.1%)	11 (0.3%)
20-29	565 (15.2%)	53 (22.5%)	618 (15.6%)
30-39	1,820 (49.0%)	90 (38.1%)	1,910 (48.4%)
40-49	955 (25.7%)	57 (24.2%)	1,012 (25.6%)
Over 49	362 (9.7%)	27 (11.4%)	389 (10.0%)
TOTAL	3,713 (100%)	236 (100%)	3,949 (100%)

Exposure Category

Over eighty-one percent of all adult male AIDS cases reported through June 30, 2001 in Long Beach reported male-to-male sexual contact (MSM) as a mode of transmission. An additional 8.7 percent reported both male-to-male sexual contact and injection drug use (IDU). Nearly seven percent of male AIDS cases reported injection drug use as the sole risk behavior. Over one percent of male cases report being infected through heterosexual contact (Table 5).

Among women in Long Beach, however, heterosexual contact and injection drug use are the prevalent modes of HIV transmission. Of all adult female AIDS cases reported in Long Beach, 51.3 percent were infected through heterosexual contact. Thirty-eight percent were infected through injection drug use. About four percent were infected through the receipt of blood transfusions or blood components, while the remaining cases (6.0%) have reported no risk or are currently under investigation (Table 6).

TABLE 5
CUMULATIVE ADULT MALE AIDS CASES BY EXPOSURE CATEGORY AND RACE/ETHNICITY, REPORTED 1981 THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

	White	Black	Hispanic	Asian/PI	Am. Ind./Alaka Nat.	Unknown	TOTAL (Row%)

With Bisexual Male	7	1	2	0	0	10
With IDU	4	14	9	0	0	27
With Transfusion Recipient	0	0	0	2	0	2
With Person with HIV/AIDS	16	29	31	4	0	80
Transfusion	5	3	1	0	0	9 (3.9%)
Pediatric Hemophilia	0	1	0	0	0	1 (0.4%)
Risk Not Reported	2	9	3	0	0	14 (6.0%)
TOTAL (Column %)	59 (25.4%)	106 (45.7%)	60 (26.0%)	6 (2.6%)	1 (0.4%)	232 (100%)

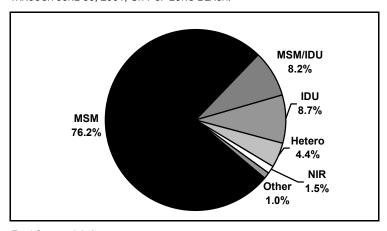

The predominant mode of HIV exposure in children is perinatal transmission (88.9%) (Table 7).

TABLE 7
CUMULATIVE PEDIATRIC AIDS CASES BY EXPOSURE CATEGORY AND RACE/ETHNICITY, REPORTED 1981 THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

	White	Black	Hispanic	TOTAL (Row %)
Mother with Risk	1	3	4	8 (88.9%)
Transfusion	1	0	0	1(11.1%)
TOTAL (Column %)	2 (22.2%)	3 (33.3%)	4 (44.4%)	9 (100%)

Combined, over three-quarters (76.2%) of Long Beach AIDS cases report sex between men as a risk factor. More than eight percent report intravenous drug use. Another eight percent report both sex between men and injection drug use. Four percent of Long Beach cases report heterosexual contact as the sole risk. Slightly more than one percent of AIDS cases in Long Beach are the result of a blood/blood product transfusion or pediatric transmission. The remaining cases did not report a risk or are currently under investigation to elucidate possible modes of transmission further (Figure 1).

FIGURE 1
CUMULATIVE AIDS CASES BY EXPOSURE CATEGORY, REPORTED 1981
THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

Total Cases = 3,949 Other = Transfusion or transplant recipient, hemophilia, and pediatric cases.

AIDS Defining Conditions

The AIDS surveillance system represents cases that have met the AIDS case surveillance reporting criteria established by the CDC. In 1993, the AIDS surveillance case definition was expanded to include a laboratory measure of severe immunosuppression (CD4+ T-lymphocyte counts of less than 200 cells/µl or a percent of total lymphocytes less than 14), pulmonary tuberculosis, invasive cervical carcinoma, and recurrent bacterial pneumonia. Prior to 1993, the surveillance definition included only opportunistic illnesses.

Mortality Rates

Table 8 presents the annual and cumulative fatality rates of AIDS cases reported in Long Beach by the year of diagnosis. The presented rates are comparable to those of Los Angeles County, California, and the United States.

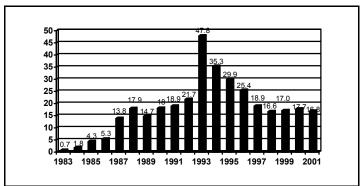

TABLE 8AIDS CASE MORTALITY BY YEAR OF DIAGNOSIS, REPORTED 1981 THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

Year	Diagnosed Cases	Deaths	Fatality Rate for Cases Diagnosed in Year	Cumulative Fatality Rate
Before 1988	412	404	_	98%
1988	220	216	98%	98%
1989	227	200	88%	95%
1990	295	258	87%	93%

TOTAL	3,949	2,351	_	60%

Impact of Changes in the AIDS Case Definition

The surveillance definition of AIDS was modified in 1985, 1987 and 1993 to reflect increased knowledge of the manifestations of HIV disease. These expanded definitions present challenges in analyzing case trends. For example, expanding the surveillance case definition in 1993 to include HIV-infected individuals with CD4+ T-lymphocyte counts below 200 cells/µl resulted in a number of new cases being reported (Figure 2).

FIGURE 2AVERAGE REPORTED AIDS CASES PER MONTH, REPORTED 1981 THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

Survival Status

By analyzing the data presented in Table 9 and comparing relative proportions of the living and the deceased, changes in the local epidemiology of advanced HIV disease may be detected as living cases are representative of more recent infections. For instance, a higher number of Blacks (20.5%) and Hispanics (23.7%) are currently living with AIDS than are deceased (14.7% and 14.1%, respectively). This demonstrates a shift toward increasing HIV infections in minorities. Similar changes are seen in the gender, age, and exposure categories.

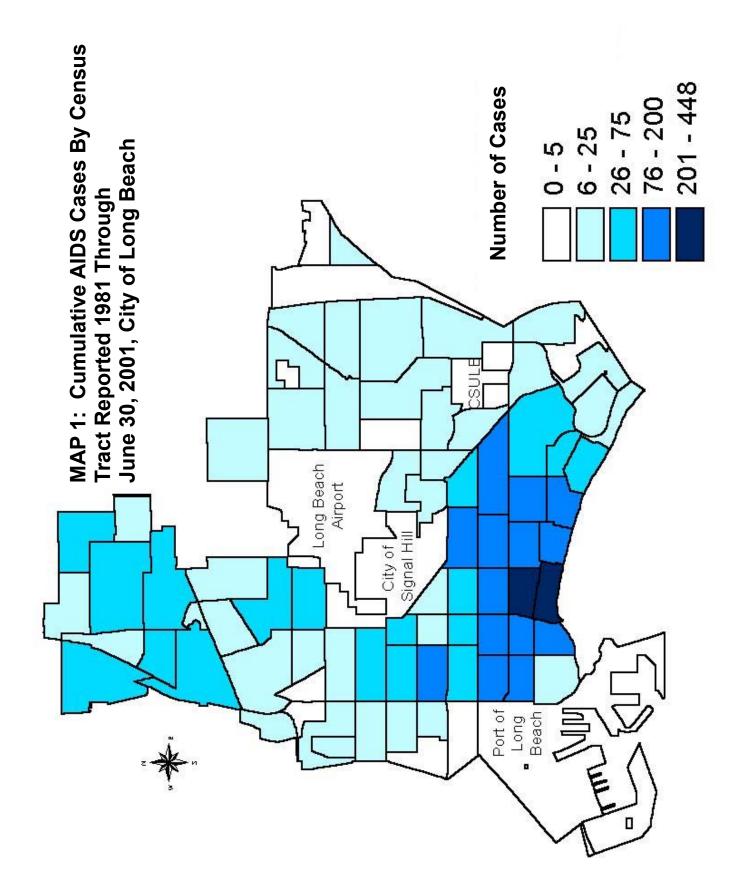

TABLE 9AIDS CASES BY SURVIVAL STATUS AND DEMOGRAPHICS, REPORTED 1981 THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

Case Profile	Living	Deceased

TOTAL	1,592 (100%)	2,351 (100%)

Geographic Information System

Geographic Information System (GIS) is a computertechnology, which combines based mapping geographical data and events such as a population, statistics, socioeconomic disease cases. vital indicators, and many other data sources to generate maps for spatial analysis. The Health Department uses GIS to monitor the health status of the community by assessing epidemiological data. This analysis determines which diseases and conditions account for the greatest morbidity and mortality in the City which allows for more localized efforts in health promotion and disease prevention efforts.

AIDS surveillance data is used to map cases by geographic location such as zip codes and census tracts in Long Beach. Geographic analysis of data allows for the provision of HIV/AIDS screening and prevention services to be targeted to individuals that are at a greater risk for infection. Mapping AIDS cases in the City may allow for a greater level of targeted outreach in the areas with a higher number of cases. Map 1 demonstrates the cumulative number of reported AIDS cases at time of diagnosis among City residents from 1981 through June 30, 2001 by census tract. This map does not take into the account the migration of individuals with AIDS moving in and out of Long Beach.

Source: City of Long Beach Department of Health and Human Services, AIDS Surveillance Program.

HIV ANTIBODY TESTING PROGRAM

The Health Department provides both anonymous and confidential HIV antibody testing to the public. HIV antibody testing also occurs through other venues in the City of Long Beach, including private physicians, hospitals and clinics. However, while AIDS is reportable in California, HIV infection is not a reportable condition. Therefore, these data reflect City-administered testing programs only.

The City has maintained data on both anonymous and confidential HIV antibody testing since the programs began. In January 1990, the California Department of Health Services, Office of AIDS implemented the HIV Test Reporting System, a computer program that collects demographics on clients and their test results to generate reports valid to local testing sites and to improve data reporting to the Office of AIDS.

"Data represents each client visit and services provided. The basic tabulated information is this client visit/service unit. A client may have made more than one HIV-related visit; each visit may be reported separately. A client may have received more than one service from different funding sources on the same visit — each reported separately. It is important to keep in mind that these data represent counseling and testing services through these programs and should NOT be interpreted as representing persons or the population of [Long Beach] in general. Recipients of these services are a highly self-selected group."

California HIV Testing and Counseling Monthly Report, 2/90

Anonymous Testing

The Alternative Test Site (ATS) program was developed for individuals wanting to know their HIV antibody status anonymously. The HIV antibody test administered in an ATS setting addressed the concern that individuals at risk for HIV infection might donate blood to determine their antibody status if blood banks were the only source of free and easily accessible testing. ATS began here in Long Beach in June 1985 and two testing sites currently exist (Table 12 and 13).

TABLE 12ANONYMOUS HIV ANTIBODY TESTS BY RACE/ETHNICITY AND AGE GROUP, APRIL 1988 THROUGH JUNE 30, 2001, CITY OF LONG BEACH.

tests performed at Health Department clinics.

TECHNICAL NOTES

These data reflect statistical monitoring activities aimed at identifying the entire range of HIV infection in Long Beach.

Data presented in this report are provisional due to reporting delays.

Surveillance and Reporting of AIDS¹

The AIDS Classification System represents cases that have met the AIDS case surveillance reporting criteria established by the Federal Centers for Disease Control and Prevention (CDC) of the Department of Health and Human Services. In September 1992, the CDC proposed the inclusion of three conditions: pulmonary tuberculosis, recurrent pneumonia, and invasive cervical cancer. and HIV-infected adolescents and adults who have CD4+ T-lymphocyte counts less than 200 cells/µL or a CD4+ percentage of less than 14, in addition to the clinical conditions listed in the 1987 surveillance case definition. This revised classification was implemented in January 1993. Persons who meet the criteria for more than one definition category are classified hierarchically in the following order: pre-1987, 1987, and 1993. Persons in the 1993 definition category only meet the 1993 definition.

Caution should be used when interpreting monthly statistics, because they can vary month to month due to a variety of factors. Therefore, looking at the long-term trends for a complete analysis of the AIDS data is necessary. Similar caution should be used in the interpretation of small numbers cases, as analyses based on small numbers are more likely to yield incorrect conclusions due to random or systematic error.

Age group tabulations are based on the person's age at diagnosis of AIDS: adult/adolescent cases include persons 13 years of age and older; pediatric cases include children under 13 years of age.

Men who have sex with men (MSM) cases include men who report sexual contact with other men (i.e., homosexual contact) and men who report sexual contact with both men and women (i.e., bisexual contact).

<u>Heterosexual contact</u> cases include persons who report either specific heterosexual contact with a person with (or at increased risk for) HIV infection (e.g., injecting drug use).

<u>Undetermined</u> cases are persons with no reported history of exposure to HIV through any of the routes listed in the hierarchy of transmission categories. These cases include: persons whose exposures are currently under investigation by local health department officials; persons whose exposure history is incomplete because they died, declined to be interviewed, or were lost to follow-up; and persons who were interviewed or for whom other follow-up information was available and no exposure mode was identified. Persons who have an exposure mode identified at the time of follow-up are reclassified into the appropriate exposure category.

Race/Ethnicity² is classified by the individual reporting the AIDS case. Usually, race/ethnicity is self reported by the patient upon enrollment with the health care provider. The definitions below represent those classifications as effectively as possible.

White, Not Hispanic: A person having origins in any of the original peoples of Europe, North Africa or the Middle East.

<u>Black, Not Hispanic</u>: A person having origins in any of the black racial groups of Africa.

<u>Hispanic</u>: A person of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish culture or origin, regardless of race.

Asian/Pacific Islander: A person having origins in any of the original people of the Far East, South East Asia, the Indian subcontinent, or the Pacific Islands. This area includes, for example, China, India, Japan, Korea, the Philippine Islands and Samoa.

American Indian/Alaska Native: A person having origins in any of the original peoples of North American, and who maintains cultural identification through tribal affiliation or community recognition.

Not Specified: Race/ethnicity was not identified and/or reported at the time of diagnosis and report. These cases are currently under investigation. Upon identification of race/ethnicity, cases will be reclassified into the appropriate category.

Incidence rate³ is defined as the number of new cases of a specified disease diagnosed or reported during a defined period of time, divided by the number of persons in a state population in which the cases occurred. This is usually expressed as cases per 1,000 or 100,000 per annum. This rate may be expressed as age— or gender-specific or as specific for any other population characteristic or subdivision.

Prevalence rate³ is defined as the total number of persons sick or portraying a certain condition in a stated population at a particular time, or during a stated period of time, regardless of when that illness or condition began, divided by the population at risk of having the disease or condition at the point in time or midway through the period in which they occurred.

¹ Definitions used here were taken mostly from the CDC HIV/AIDS Surveillance Report, Technical Notes section.

NOTICE TO HEALTH CARE PROVIDERS AND OTHERS RESPONSIBLE FOR DISEASE REPORTING

California Code of Regulations, Title 17, Section 2500 requires that all diagnosed or suspected cases of AIDS as defined by CDC must be reported within seven (7) days to the Health Officer. To obtain information on the CDC AIDS case definition, to obtain case report forms or to report a case, contact:

City of Long Beach
Department of Health and Human Services
AIDS Surveillance Program
2525 Grand Avenue
Long Beach, CA 90815
Phone (562) 570-4311

HIV/AIDS MONITORING REPORT

Attention Health Care Providers

The California Code of Regulations, Title 17, Section 2500, requires the report of communicable diseases and conditions. To report a case of a communicable disease, contact the City of Long Beach Department of Health and Human Services Epidemiology Program at 562-570-4302 or by fax at 562-570-4374.

 \dagger = Report immediately by telephone when two (2) or more cases or suspected cases of foodborne disease from separate households are suspected to have the same source of illness.

= Report immediately by telephone.
All other diseases/conditions should be reported by FAX, telephone, or mail within seven (7) calendar days of identification.
